12.13.4.5 Question: Find the probability distribution of the number of successes in two tosses of a die, where a success is defined as

- i) number greater than 4
- ii) six appears on at least one die

Solution:

Let *X* be a random variable denoting the outcome of a die toss so,

$$X = \{1, 2, 3, 4, 5, 6\} \tag{1}$$

i) Let the Cumulative Distribution function be:

$$F_X(i) = \Pr(X \le i) \tag{2}$$

$$=\sum_{n=1}^{n=i}\Pr\left(X=n\right)\tag{3}$$

Now,

$$\Pr(X = i) = \frac{1}{6} \ \forall 1 \le i \le 6$$
 (4)

$$\therefore F_X(i) = \sum_{i=1}^{n=i} \frac{1}{6} \tag{5}$$

$$\implies F_X(i) = i/6$$
 (6)

Now,

$$Pr(X > 4) = F_X(6) - F_X(4)$$
 (7)

$$= \frac{6}{6} - \frac{4}{6}$$
 (9)
= $\frac{1}{3}$ (10)

 $\therefore \frac{1}{3}$ is the probability of success in this case for a die.

Now,

Let *Y* be the random variable denoting number of successes.

$$\therefore Y \sim Bin(n, p) \tag{11}$$

where n = 2 and $p = \frac{1}{3}$

$$\therefore \Pr(Y = i) = {}^{2}C_{i}(1 - p)^{2-i}p^{i} \qquad (12)$$

By (12),

$$p_Y(k) = \begin{cases} \frac{4}{9}, & k = 0\\ \frac{4}{9}, & k = 1\\ \frac{1}{9}, & k = 2\\ 0, & \text{otherwise} \end{cases}$$

ii) Let p' be the probability of getting 6 in a die toss.

:.

$$p' = \Pr(X = 6) \tag{13}$$

$$=\frac{1}{6}\tag{15}$$

Let *Y* be a random variable denoting the number 6's in die tosses,

$$\therefore Y \sim Bin(n, p') \tag{16}$$

where
$$n = 2$$
 and $p' = \frac{1}{6}$ (17)

$$\therefore \Pr(Y = i) = {}^{2}C_{i}p^{\prime i}(1 - p^{\prime})^{(2-i)}$$
 (18)

$$\implies \Pr(Y = i) = {}^{2}C_{i} \left(\frac{1}{6}\right)^{i} \left(\frac{5}{6}\right)^{(2-i)}$$
 (19)

Let the Cumulative Distribution function be:

$$F_Y(i) = \Pr(Y \le i) \tag{20}$$

$$\implies F_Y(i) = \sum_{n=0}^{n=i} \Pr(Y = n) \qquad (21)$$

Let *p* denote the probability of success in this case.

$$\therefore p = F_Y(2) - F_Y(0)$$
(22)
by (19),(21)
$$= \sum_{n=0}^{n=2} \Pr(Y = n) - \sum_{n=0}^{n=0} \Pr(Y = n)$$
(24)
$$= {}^{2}C_2 \left(\frac{1}{6}\right)^2 \left(\frac{5}{6}\right)^0 + {}^{2}C_1 \left(\frac{1}{6}\right)^1 \left(\frac{5}{6}\right)^1$$
(25)
$$\implies p = \frac{11}{36}$$
(26)

Let Z be a random variable denoting number of successes.

$$\therefore Z \sim Ber(p) \tag{27}$$

where
$$p = \frac{11}{36}$$
 by (26) (28)

$$\therefore \qquad (29)$$

$$p_Z(k) = \begin{cases} \frac{25}{36}, & k = 0\\ \frac{11}{36}, & k = 1\\ 0, & \text{otherwise} \end{cases}$$
