12.13.6.12 Question: Suppose we have four boxes A,B,C and D containing coloured marbles as given in table below:

Here,

Box	Marble colour		
	Red	White	Black
A	1	6	3
В	6	2	2
C	8	1	1
D	0	6	4

Table 1: Question Table

One of the boxes has been selected at random and a single marble is drawn from it. If the marble is red, what is the probability that it was drawn from

- 1) Box A?
- 2) Box B?
- 3) Box C?

Answer: 1) $\frac{1}{15}$ 2) $\frac{2}{5}$ 3) $\frac{8}{15}$

Solution:

Events	Definition	
E	drawn marble is red	
E_1	selected box is A	
E_2	selected box is B	
E_3	selected box is C	
E_4	selected box is D	

Table 2: Events Table

$$\Pr(E|E_1) = \frac{1}{10} \tag{1}$$

$$\Pr(E|E_2) = \frac{6}{10} \tag{2}$$

$$\Pr(E|E_3) = \frac{8}{10} \tag{3}$$

$$\Pr(E|E_4) = \frac{0}{10} \tag{4}$$

$$Pr(E_1) = Pr(E_2) = Pr(E_3) = Pr(E_4) = \frac{1}{4}$$
 (5)

 $\Pr(E_1 \cup E_2 \cup E_3 \cup E_4) = 1 \tag{6}$

$$\Pr(E_i E_j) = 0 \forall 1 \le i < j \le 4 \tag{7}$$

We can write,

As.

Probability of chosen box being A given that drawn marble is red is given by: $Pr(E_1|E)$

Probability of chosen box being B given that drawn marble is red is given by: $Pr(E_2|E)$

Probability of chosen box being C given that drawn marble is red is given by: $Pr(E_3|E)$

$$\Pr(E) = \sum_{i=1}^{i=4} \Pr(EE_i)$$
 (8)

$$Also,$$
 (9)

$$\Pr(E/E_i) = \frac{\Pr(EE_i)}{\Pr(E_i)}$$
 (10)

$$\implies \Pr(EE_i) = \Pr(E/E_i)\Pr(E_i)$$
 (11)

(30)

(33)

(34)

(37)

(38)

Now,

$$Pr(E_3|E) = \frac{Pr(EE_3)}{Pr(E)}$$
(31)

By equation
$$11$$
 (32)

 $Pr(E_3|E) = \frac{Pr(E/E_3)Pr(E_3)}{Pr(E)}$

$$By equation 10 (12)$$

$$\Pr(E_1|E) = \frac{\Pr(EE_1)}{\Pr(E)}$$
 (13)

By equation 10

By equation
$$11$$
 (14)

$$\Pr(E_1|E) = \frac{\Pr(E/E_1)\Pr(E_1)}{\Pr(E)}$$
 (15)

$$\Pr(E_3|E) = \frac{\Pr(E|E_3)\Pr(E_3)}{\sum_{i=1}^{i=4} (\Pr(E|E_i)\Pr(E_i))}$$

$$= \frac{\frac{8}{10} \times \frac{1}{4}}{\frac{1}{10} \times \frac{1}{4} + \frac{6}{10} \times \frac{1}{4} + \frac{8}{10} \times \frac{1}{4} + \frac{0}{10} \times \frac{1}{4}}$$
(36)

By equations 8 and 11

$$\Pr(E_1|E) = \frac{\Pr(E|E_1)\Pr(E_1)}{\sum_{i=1}^{i=4} (\Pr(E|E_i)\Pr(E_i))}$$
(

$$= \frac{\frac{\frac{1}{10} \times \frac{1}{4}}{\frac{1}{10} \times \frac{1}{4} + \frac{6}{10} \times \frac{1}{4} + \frac{8}{10} \times \frac{1}{4} + \frac{0}{10} \times \frac{1}{4}}{(18)}$$

(16)

$$= \frac{\frac{1}{40}}{\frac{15}{40}}$$
 (19)
= $\frac{1}{15}$ (20)

$$=\frac{1}{15}$$
 (20)

$$By equation 10 (21)$$

$$Pr(E_2|E) = \frac{Pr(EE_2)}{Pr(E)}$$
 (22)

By equation
$$11$$
 (23)

$$\Pr(E_2|E) = \frac{\Pr(E/E_2)\Pr(E_2)}{\Pr(E)}$$
 (24)

$$\Pr(E_{2}|E) = \frac{\Pr(E|E_{2})\Pr(E_{2})}{\sum_{i=1}^{i=4}(\Pr(E|E_{i})\Pr(E_{i}))}$$

$$= \frac{\frac{6}{10} \times \frac{1}{4}}{\frac{1}{10} \times \frac{1}{4} + \frac{6}{10} \times \frac{1}{4} + \frac{8}{10} \times \frac{1}{4} + \frac{0}{10} \times \frac{1}{4}}$$

$$= \frac{\frac{6}{40}}{\frac{15}{40}}$$

$$= \frac{2}{2}$$
(29)
