12.13.4.5 Question: Find the probability distribution of the number of successes in two tosses of a die, where a success is defined as
(i) number greater than 4
(ii) six appears on at least one die
Solution:
Let X be a random variable denoting the outcome of a die toss so,

$$X = \{1, 2, 3, 4, 5, 6\} \qquad (1)$$

(i)
Let the Cumulative Distribution function be:

$$F_X(i) = \Pr(X \leq i) \qquad (2)$$

$$= \sum_{n=1}^{n=i} \Pr(X = n) \qquad (3)$$

Now,

$$\Pr(X = i) = \frac{1}{6} \ \forall 1 \leq i \leq 6 \qquad (4)$$

$$\therefore F_X(i) = \sum_{n=1}^{n=i} \frac{1}{6} \qquad (5)$$

$$\implies F_X(i) = i/6 \qquad (6)$$

Now,

$$\Pr(X > 4) = F_X(6) - F_X(4) \qquad (7)$$

$$= \frac{6}{6} - \frac{4}{6} \qquad (8)$$

$$(by \ (6)) \qquad (9)$$

$$= 1 - \frac{2}{3} \qquad (10)$$

$$= \frac{1}{3} \qquad (11)$$

$\therefore \frac{1}{3}$ is the probability of success in this case for a die.
Now,

Let Y be the random variable denoting number of successes.

$$\therefore Y \sim Bin(n, p) \qquad (12)$$

where n=2 and p = $\frac{1}{3}$

$$\therefore \Pr(Y = i) = \binom{2}{i}(1 - p)^{2-i}p^i \qquad (13)$$

By (13),

$$\Pr(Y = 0) = \binom{2}{0}(\frac{2}{3})^2(\frac{1}{3})^0 \qquad (14)$$

$$= \frac{4}{9} \qquad (15)$$

$$\Pr(Y = 1) = \binom{2}{1}(\frac{2}{3})^1(\frac{1}{3})^1 \qquad (16)$$

$$= 2 \times \frac{2}{3} \times \frac{1}{3} \qquad (17)$$

$$= \frac{4}{9} \qquad (18)$$

$$\Pr(Y = 2) = \binom{2}{2}(\frac{2}{3})^0(\frac{1}{3})^2 \qquad (19)$$

$$= \frac{1}{9} \qquad (20)$$

$\therefore$

$$\Pr(Y = i) = \begin{cases} \frac{4}{9}, & i = 0 \\ \frac{4}{9}, & i = 1 \\ \frac{1}{9}, & i = 2 \\ 0, & \text{otherwise} \end{cases}$$

(ii)

Let p denote the probability of success in this case.

∴ 1-p is probability of failure i.e., getting no 6

$$\therefore 1 - p = F_X(5)F_X(5) \tag{21}$$

$$\text{by (6)} \tag{22}$$

$$= \frac{5}{6} \times \frac{5}{6} \tag{23}$$

$$= \frac{25}{36} \tag{24}$$

$$\implies p = 1 - \frac{25}{36} \tag{25}$$

$$\implies p = \frac{11}{36} \tag{26}$$

Let Z be a random variable denoting number of successes.

$$\therefore Z \sim Ber(p) \tag{27}$$

where p=$\frac{11}{36}$ by (26)

∴

$$\Pr(Z = i) = \begin{cases} \frac{25}{36}, & i = 0 \\ \frac{11}{36}, & i = 1 \\ 0, & \text{otherwise} \end{cases}$$
